FIRMWARE VERSION 1.0.3.11

PRODUCT NAME

GWN7711, GWN7711P, GWN7710R

DATE

09/12/2024

FIRMWARE FILE INFORMATION

GWN7711, 7711P, 7710R Firmware file name: gwn771xfw.bin
 MD5 checksum: 75123a2286a960a5292a894ef3da1bbc

CHANGES/ENHANCEMENT

- Added support for LLDP features.
- Added support for SNMP features.
- Added support for spanning tree features.
- Added support for Admin VLAN features.
- Added support for DHCP SNOOPING features.
- Added support for PoE ping watchdog features.
- Added support for ',' character for password
- Added support to allow user to paste a MAC address separated by '-' in MAC field, for example: E0-BE-03-82-8E-2E.
- Added support for latest GWN Cloud features.
- Added support for latest GWN Manager features.
- GWN7710R added support for configuring all LED lights ON or OFF through webpage.
- Optimize and adjust some task stack memory allocation
- Changed to turn off all PoE led before upgrade restart avoid indicator color confusion.
- Changed backup filename to Model + Mac Address instead of config + timestamp.
- Fixed the cable length detection error is relatively large when using a 100m cable.
- Fixed network upgrade page. The HTTP/HTTPS user name and password cannot support 32 bits.
- Fixed the issue that after all network cables of the device are unplugged, the IP address should be restored to 192.168.0.254.
- Fixed the issue that when no device is connected, the port indicator should not be on.
- Fixed the issue that manually uploaded firmware should not enter led flashing mode.
- Fixed the issue that DHCP Otion 43 b.http upgrade mode fails.
- Fixed the issue that after the DHCP server is switched to obtain an IP address, the client address of the lease renewal packet is incorrect.
- Fixed the issue that the port indicator should not flash orange when the supply standard is 24V DC 2Pair.
- Internal bug fixes.

NEW FEATURE OVERVIEW

• Added support for Spanning Trees

Devices running this protocol discover loops in the network by exchanging information with each other, selectively block certain ports, and finally prune the loop network into a loop-free tree network structure, to prevent packets from multiplying and looping indefinitely in the loop network. Avoid the problem of degrading the packet processing capacity caused by the device receiving the same message repeatedly.

• Added support for PoE watchdog

The watchdog function on the PoE port is added to check the connection between the device and the destination IP address by sending ping packets. When a link failure is detected, the PoE port will automatically power off and restart to help solve problems such as device failure and unresponsiveness in the environment.

• Add support for SNMP function

The SNMP feature manages network resources by allowing the central computer of the network management software, i.e., the network management workstation. Basic functions include monitoring port enablement, PoE power supply, detecting and analyzing network errors, and configuring network devices.

• Add support for LLDP function

The LLDP feature allows network devices to periodically send their own device information to neighbor devices. The network management system can obtain the switch information through the protocol and query and judge the communication status of the link.

• Support DHCP Snooping feature

DHCP Snooping is a security feature of DHCP that ensures that the DHCP client obtains the IP address from the legitimate DHCP server and records the correspondence between the DHCP client and MAC address and other parameters to prevent attacks against DHCP on the network.
